

Nimbus Analytics: Business Context and Current Problems

We are Nimbus Analytics, a B2B SaaS company providing cloud-based data analytics dashboards. We have operated since January 2024. Our customer base is roughly 500 accounts across three segments: SMB (our largest group, on the Starter tier), Mid-Market (on the Growth tier), and a small number of Enterprise accounts on custom contracts. We operate across the US, UK, Germany, and France, and we bill in EUR. Our revenue model is monthly subscription.

We are currently facing four specific problems that we need help addressing.

Problem 1: SMB churn after our price increase. In August 2025 we raised the Starter tier price from 89 EUR to 125 EUR, a 40 percent increase. Our internal projection expected around 5 percent churn. The actual churn was far higher than projected and concentrated in the months right after the change. SMB is our largest segment by customer count, so this loss hurts. We need to know how to stop the bleeding and stabilise SMB retention, ideally without simply reversing the price increase.

Problem 2: Loss of customer trust after a product incident. In December 2025 we had a reliability incident where dashboards rendered blank or broken for a stretch of weeks. It generated a heavy spike in support tickets. We are worried about the longer-term damage to customer trust and want to know how to rebuild confidence with affected customers.

Problem 3: We cannot see at-risk accounts early enough. We had an Enterprise account that expanded strongly in our first year, then declined and eventually churned. By the time we recognised the account was in trouble, it was effectively too late to save it. We do not currently have a reliable way to spot at-risk accounts before they churn, and we want to fix that.

Problem 4: Our growth depends too heavily on price increases. Our recent revenue growth has leaned on raising prices on the SMB base, and the churn fallout shows that is not sustainable. We need ways to grow revenue that do not depend on charging existing SMB customers more.

Our goals for the next two quarters: reduce SMB churn and stabilise our largest segment, rebuild trust after the December incident, detect at-risk accounts earlier, and find growth that does not rely on further SMB price increases.

Constraints: we are a small company with a lean team. We cannot afford broad discounting across the whole SMB base, and we need strategies that a small team can realistically execute. We prefer retention and product-led approaches over heavy sales spend.
